

# Permanent Magnet Hysteresis Brakes & Clutches

- **Non-electrical**
- **No wearing parts**
- **Precise, permanent tension control**

**TRANSMITTING TORQUE THROUGH AIR**

## Why Mag Tech Brakes & Clutches are Better

- No electricity
- No break-away torque
- Constant torque independent of shaft (rotor) speed
- No contacting or wearing parts
- No friction elements — same smooth torque year after year
- No magnetic particles to leak or contaminate end product
- Operable in some of the most difficult environments
- Brake (with shaft) and clutch (with hollow shaft) available
- Custom designs available

**Green** Ball bearings for light duty or tapered roller bearings for heavy overhung loads guarantee the right brake for your application.

**Purple** We magnetize all our own magnets to give you the right amount of poles, gauss and saturation for your application. This guarantees that brakes and clutches purchased from us years ago are the same as those purchased today.

**Blue** Special clamping arrangement allows easy disassembly and interchangeability should you decide to change a shaft, or to service our brakes at some time in the future.

**Yellow** The hysteresis disc is the heart of our design. The heat treating and grinding of this element assure years of trouble-free performance.

**Brown** Hundreds of shaft variations are available. Simply specify the shaft dimensions "A" and "B" for custom designs. On all of our ball bearing designs, the shafts can be easily interchanged and reversed in the field.

## How Mag Tech Brakes & Clutches Operate

All important internal clearances are ground to tolerances of less than .025mm (.001 inch). Magnet assemblies (purple) surround our hysteresis assembly (gold). When like poles face each other, they produce maximum magnetic saturation of the hysteresis disc, forcing lines of flux to travel circumferentially through the hysteresis disc. This produces maximum torque.

When opposite poles face each other they produce minimum saturation of the hysteresis disc. The lines of flux travel through the hysteresis disc. This produces minimum torque.

Combinations of adjustment angles between the two extremes give infinite adjustability. Because there are no contacting surfaces, the setting can be maintained indefinitely.

**Max Torque**

**Min Torque**

## Discover Magnetic Technologies

Since 1984 we have been designing and manufacturing high-quality permanent magnet hysteresis & eddy current brakes and clutches. We serve many industries including capping, wire & cable, fiber-optics, aerospace, converting, power transmission and medical. Magnetic brakes and clutches is our business.

We have the inventory, machinery and personnel to give you the very best magnetic brakes and clutches available. Whether you choose one of our standard models or require a custom design, our engineers understand tensioning, torque limiting and various applications that work best for magnetic brakes and clutches.

This catalog shows some of our more typical and popular units but only a fraction of our capabilities. Consult our website for more applications or call us with your request for a different shaft, coupling or a custom design. We know magnetic brakes and clutches.

## Popular Mounting Arrangements

### As a Coupling

This is for load protection or torque limiting. The coupling style unit is directly connected to a motor and turns at the same speed as the motor until the torque is reached. At this point it will slip and still generate the max torque.

### As a Clutch

The unit is connected to a motor by a timing belt or gear. The housing is driven and the shaft is the output end.

### As a Pay-Off Brake

Brake is stationary and the reel or material is fitted to the output shaft. The tension on the material will vary with the diameter.

# 513

## MODEL 513

Torque .001 to .014 Nm (.11 to 2 in. oz)

BENDING MOMENT .22 Nm (2 in lbs)

HEAT DISSIPATION 2.2 watts

## LOW TORQUE

Also available in:

-1 torque .001 to .007 Nm (.11 to 1 in. oz)

-2 torque .0003 to .002 Nm (.042 to .28 in. oz)

Specify -1 or -2 at end of the part number. Example: 513-001-1

## CONSTANT TENSION

Shown is 600-040L  
(left hand configuration)

## MODEL 600

Designed to provide constant surface tension.  
This brake has a urethane housing that rides on the material diameter insuring constant tension.

MODEL	TENSION RANGE	UNIT WEIGHT	HEAT DISSIPATION
600-040L	.23 to 3 kg (.5 to 6.4 lbs.)	4.6 kg (10.7 lbs.)	28 watts

Call or see our website for more information.

CONSTANT TENSION BRAKE WITH FOLLOWER ARM

# CT12

Torque 0.03 to 1.36 Nm (3 to 12 in lbs)  
HEAT DISSIPATION 28 Watts

# CT36

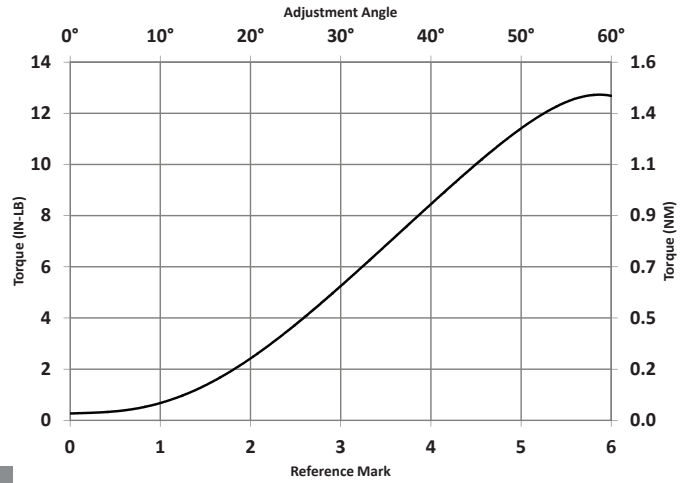

Torque 0.14 to 4.0 Nm (1.2 to 36 in lbs)  
HEAT DISSIPATION 95 Watts

# CT70

Torque 0.34 to 7.9 Nm (3 to 70 in lbs)  
HEAT DISSIPATION 150 Watts

## MODEL CT12

## MODEL CT36

## MODEL CT70

The follower arm rides on diameter "d<sub>1</sub>" following material down to diameter "d<sub>2</sub>". "Arm angle" change decreases the brake torque to maintain constant tension from "d<sub>1</sub>" to "d<sub>2</sub>". Recommended for dedicated applications.

# 822

**CUSTOM PAYOFF STANDS**

## MULTI POSITION VERTICAL STAND

Tubular steel construction. Posts rotate, fits various Mag Tech brakes, small footprint. Visit our website or call the factory for more information.

# 600

**CUSTOM PAYOFF STANDS**

## CONSTANT TENSION STAND

Portable stand using our 600 type brakes for surface tensioning. Available in several sizes. Visit our website or call the factory for more information.

# 673

**CUSTOM PAYOFF STANDS**

## MULTI POSITION HORIZONTAL STAND

Movable with casters. Fits 527, 609, 523, and many other models. Visit our website or call the factory for more information.

# FastLock

Fast locking collars.  
One hand operation, no tools required.  
Usable on non-hardened shafts.  
Shaft tolerance  $+0.02$  to  $-0.38\text{mm}$  ( $+0.001$  to  $-0.015$  in.)

720-0150	38.10	1.500	60.5	2.38	22.1	0.87

Drive Pin Adjustable Every 5 mm (.197 in)

# Selection Criteria and Calculations

For every application determine the **TORQUE**, **MAXIMUM RPM**, and for brakes, the **BENDING MOMENT**. Then you can choose the correct shaft or coupling, and various accessories.

## Three Steps to Selection

### 1. TORQUE

The line tension multiplied by the radius of a full spool.

Example:

$$\begin{aligned} \text{Torque} &= \text{Full Spool Radius}(r) \times \text{Line Tension}(T) \\ &.15\text{m} \times 8 \text{ N} = 1.2 \text{ Nm} \\ &5.9 \text{ in} \times 1.8 \text{ lbs} = 10.6 \text{ in lbs} \end{aligned}$$

**Selection:** In this example Model 523 or larger will work.

### EXAMPLE SELECTION CRITERIA

Required Information	Example	
Line Tension (T)	8N	1.8 lbs.
Spool Weight (W)	134N	30 lbs.
Full Spool Radius (r)	.15m	5.9 in.
Spool Core Diameter(d)	.125m	.41 ft.
Spool Centerline Distance (L)	.11m	4.5 in.
Line Speed	90m/min.	295 ft/min

### 2. BENDING MOMENT

The total weight multiplied by the Spool Centerline Distance (L).

Example:

$$\begin{aligned} \text{Bending Moment} &= \text{Spool Weight (W)} \times \text{Spool Centerline Distance (L)} \\ &134\text{N} \times .11\text{m} = 14.7\text{Nm} \\ &30 \text{ lbs} \times 4.5 \text{ in} = 135 \text{ in lbs} \end{aligned}$$

**Selection:** In this example Model 610 or larger will work.

### HANDY CONVERSION TABLES

Torque	To	Multiply By:	Force	To	Multiply By:	Length	To	Multiply By:	Velocity	To	Multiply By:
lbf. in.	Nm	0.113	lbf	N	4.448	in	mm	25.4	fps	m/s	0.305
ozf. in.	Nm	0.0071	kgf	N	9.807	in	m	0.0254	fpm	m/min	.305
lbf. ft.	Nm	1.356	gf	N	.009807	ft	m	0.305	m/min	f/min	3.281
kgf. m	Nm	9.807	N	lbf	0.225	mm	in	0.0394	m/s	fps	3.281
Ncm	Nm	0.01	N	kgf	0.102	m	in	39.370

Nm	ozf. in.	141.60	kg	lbf	2.2046						
Nm	ibf. ft.	0.737	lbf	kg	.4536						
Nm	kgf. m	0.102									
Nm	Ncm	100.0									
			Temperature						Inertia	To	Multiply By:
			°C = (°F - 32) x $\frac{5}{9}$						kgm <sup>2</sup>	gcm <sup>2</sup>	10 <sup>7</sup>
									gcm <sup>2</sup>	oz in <sup>2</sup>	0.0054
									oz in <sup>2</sup>	gcm <sup>2</sup>	182.9

### 3. OPERATING CURVES

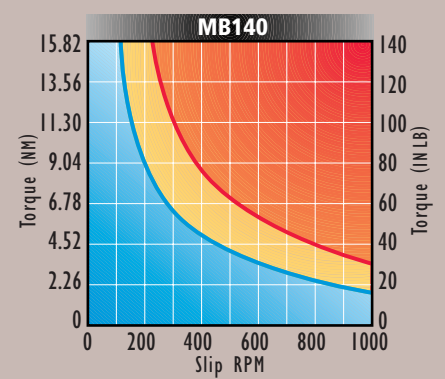

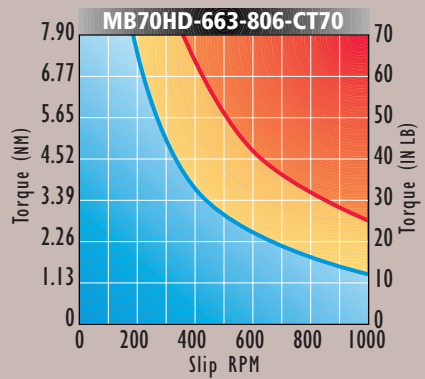

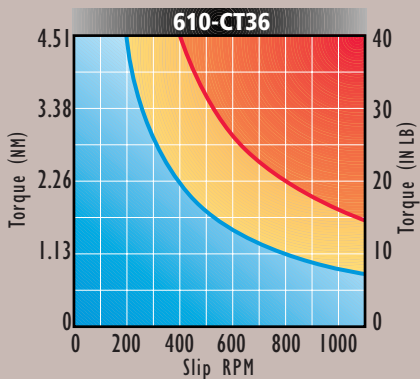

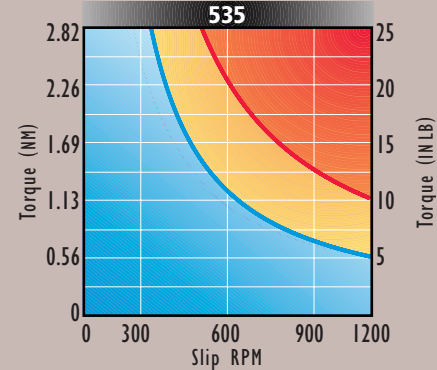

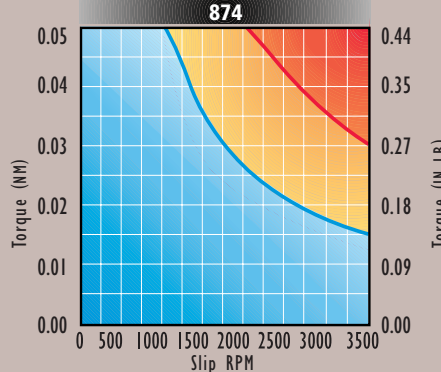

When a magnetic brake shaft is turning, mechanical energy is converted into thermal energy (watts). The amount of thermal energy (watts) is a function of the RPM and the TORQUE SETTING.

**CALCULATE MAX RPM:** Example calculation:

$$\text{Max RPM} = \frac{\text{Line Speed}}{\pi \times \text{Core Dia.}(d)} = \frac{90\text{m/min}}{3.14 \times .125\text{m}} = \frac{295 \text{ ft/min}}{3.14 \times .41 \text{ ft}} = 229 \text{ RPM}$$

With the torque calculated in (1) and the maximum RPM calculated in (3), refer to operating curves to determine if your application is within the safe operating range of the brake.

**Selection:** In this example, Model 523 or larger will work, however... CONSIDERING TORQUE, BENDING MOMENT AND MAX RPM, THE BEST CHOICE IS MODEL 610.

**HOW TO USE THE CURVES:** Find the slip RPM on the X axis and the torque on the Y axis. The blue area represents safe continuous duty. The area between the two curves (yellow) represents intermittent duty, such as, five minutes on, five minutes off. Operating above the red line for any period of time will cause overheating. This could damage the unit.

For Magnetic Brakes & Clutches we have the experience and know-how to improve your application!

Powered take-up: Two flanged bearings support shaft and the housing is powered.

Retrofit application using Model 523 and 700-002M Mounting Bracket on Twister.

Torque limiting application using Model 610 with custom adaptor and gear.

Tensioning films & foils. Model 527 with urethane "nib" roller.

Perfect for "flyer" type applications: adjustable, accurate and no electricity.

## Put Magnetic Technologies to work for you

Payoff application on roll of film cleaning material.

Tensioning Aramid Yarn using Model 523 with Spiked Drive Plate Assembly #750-034.

More torque in tight environments with a 3:1 gear ratio.
